Rules of Inference

The Argument

 We can express the premises (above the line) and the conclusion (below the line) in predicate logic as an argument:

$$\forall x(Man(x) \rightarrow Mortal(x))$$

$$Man(Socrates)$$

$$Mortal(Socrates)$$

We will see shortly that this is a valid argument.

- We will show how to construct valid arguments in two stages; first for propositional logic and then for predicate logic. The rules of inference are the essential building block in the construction of valid arguments.
 - Propositional Logic
 Inference Rules
 - 2. Predicate Logic

Inference rules for propositional logic plus additional inference rules to handle variables and quantifiers.

Arguments in Propositional Logic

- A *argument* in propositional logic is a sequence of propositions. All but the final proposition are called *premises*. The last statement is the *conclusion*.
- The argument is valid if the premises imply the conclusion. An argument form is an argument that is valid no matter what propositions are substituted into its propositional variables.
- If the premises are $p_1, p_2, ..., p_n$ and the conclusion is q then $(p_1 \land p_2 \land ... \land p_n) \rightarrow q$ is a tautology.
- Inference rules are all argument simple argument forms that will be used to construct more complex argument forms.

Rules of Inference for Propositional Logic: Modus Ponens

Corresponding Tautology:

 $(p \land (p \rightarrow q)) \rightarrow q$

 $\begin{array}{c} p \to q \\ \hline p \\ \hline \vdots \\ q \end{array}$

Example:

Let *p* be "It is snowing." Let *q* be "I will study discrete math."

"If it is snowing, then I will study discrete math."

"It is snowing."

"Therefore, I will study discrete math."

Modus Tollens

p –	\rightarrow	q
$\neg q$		

Corresponding Tautology:

$$(\neg p \land (p \rightarrow q)) \rightarrow \neg q$$

$\therefore \neg p$ Example:

Let *p* be "it is snowing." Let *q* be "I will study discrete math."

"If it is snowing, then I will study discrete math."
"I will not study discrete math."

"Therefore, it is not snowing."

Hypothetical Syllogism

Corresponding Tautology:

$$((p \rightarrow q) \land (q \rightarrow r)) \rightarrow (p \rightarrow r)$$

$$\begin{array}{c}
p \to q \\
q \to r \\
\hline
\therefore p \to r
\end{array}$$

Example:

Let *p* be "it snows." Let *q* be "I will study discrete math." Let *r* be "I will get an A."

"If it snows, then I will study discrete math."
"If I study discrete math, I will get an A."

"Therefore, If it snows, I will get an A."

Disjunctive Syllogism

Corresponding Tautology:

 $\begin{array}{c} p \lor q \\ \neg p \\ \hline \therefore q \end{array}$

Example:

Let *p* be "I will study discrete math." Let *q* be "I will study English literature."

 $(\neg p \land (p \lor q)) \rightarrow q$

"I will study discrete math or I will study English literature." "I will not study discrete math."

"Therefore, I will study English literature."

Addition

Corresponding Tautology:

$$p \rightarrow (p \lor q)$$

$\frac{p}{\therefore p \vee q}$

Example:

Let *p* be "I will study discrete math." Let *q* be "I will visit Las Vegas."

"I will study discrete math."

"Therefore, I will study discrete math or I will visit Las Vegas."

Simplification

$$\frac{p \wedge q}{\therefore q}$$

Corresponding Tautology:

 $(p \land q) \rightarrow p$

Example:

Let *p* be "I will study discrete math." Let *q* be "I will study English literature."

"I will study discrete math and English literature"

"Therefore, I will study discrete math."

Conjunction

$$\frac{p}{q}$$

$$\therefore p \land q$$

Corresponding Tautology:

$$((p) \land (q)) \rightarrow (p \land q)$$

Example:

Let *p* be "I will study discrete math." Let *q* be "I will study English literature."

"I will study discrete math."

"I will study English literature."

"Therefore, I will study discrete math and I will study English literature."

Resolution

Resolution plays an important role in AI and is used in Prolog.

$\frac{\neg p \lor r}{p \lor q}$ $\therefore q \lor r$

Corresponding Tautology:

$$((\neg p \lor r) \land (p \lor q)) \rightarrow (q \lor r)$$

Example:

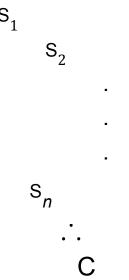

Let *p* be "I will study discrete math." Let *r* be "I will study English literature." Let *q* be "I will study databases."

"I will not study discrete math or I will study English literature." "I will study discrete math or I will study databases."

"Therefore, I will study databases or I will English literature."

Using the Rules of Inference to Build Valid Arguments

- A *valid argument* is a sequence of statements. Each statement is either a premise or follows from previous statements by rules of inference. The last statement is called conclusion.
- A valid argument takes the following form:

Example 1: From the single proposition $p \land (p \rightarrow q)$

Show that *q* is a conclusion.

Solution:

Step	Reason
1. $p \land (p \rightarrow q)$	Premise
2. p	Conjunction using (1)
$3. p \rightarrow q$	Conjunction using (1)
4. q	Modus Ponens using (2) and (3)

Example 2:

- With these hypotheses:
 - "It is not sunny this afternoon and it is colder than yesterday."
 - "We will go swimming only if it is sunny."
 - "If we do not go swimming, then we will take a canoe trip."
 - "If we take a canoe trip, then we will be home by sunset."
- Using the inference rules, construct a valid argument for the conclusion:
 - "We will be home by sunset."

Solution:

- Choose propositional variables:
 - p: "It is sunny this afternoon." r: "We will go swimming." t: "We will be home by sunset."
 - q: "It is colder than yesterday." s: "We will take a canoe trip."
- 2. Translation into propositional logic:

Hypotheses:
$$\neg p \land q, r \rightarrow p, \neg r \rightarrow s, s \rightarrow t$$

Conclusion: t

Continued on next slide \Box

3. Construct the Valid Argument

\mathbf{Step}	Reason
1. $\neg p \land q$	Premise
$2. \neg p$	Simplification using (1)
3. $r \to p$	Premise
$4. \neg r$	Modus tollens using (2) and (3)
5. $\neg r \rightarrow s$	Premise
6. s	Modus ponens using (4) and (5)
7. $s \to t$	Premise
8. <i>t</i>	Modus ponens using (6) and (7)

Handling Quantified Statements

- Valid arguments for quantified statements are a sequence of statements.
 Each statement is either a premise or follows from previous statements by rules of inference which include:
 - Rules of Inference for Propositional Logic
 - Rules of Inference for Quantified Statements
- The rules of inference for quantified statements are introduced in the next several slides.

Universal Instantiation (UI)

$$\frac{\forall x P(x)}{\therefore P(c)}$$

Example:

Our domain consists of all dogs and Fido is a dog.

"All dogs are cuddly."

"Therefore, Fido is cuddly."

Universal Generalization (UG)

$$\frac{P(c) \text{ for an arbitrary } c}{\therefore \forall x P(x)}$$

Used often implicitly in Mathematical Proofs.

Existential Instantiation (EI)

$$\exists x P(x)$$

 $\therefore P(c)$ for some element c

Example:

"There is someone who got an A in the course."

"Let's call her *a* and say that *a* got an A"

Existential Generalization (EG)

$$P(c)$$
 for some element c
 $\therefore \exists x P(x)$

Example:

"Michelle got an A in the class."

"Therefore, someone got an A in the class."
